

Task1_QA_Report_AnkitaSharma

Introduction

Performed manual QA testing on the RealWorld Demo Application to evaluate the functionality, validation mechanisms, usability and overall user experience of the application. The testing process included core user workflows such as user signup, sign in, article creation, editing, deletion, profile settings management and logout functionality. The primary objective of this assessment was to identify functional, validation and usability issues that could impact production readiness, application reliability and end-user experience.

Bug Report Table

#	Title / Summary	Steps to Reproduce	Expected vs Actual	Severity	Suspected Cause
1	Invalid Email Validation During Signup	1. Open signup page 2. Enter invalid email format such as test@abc 3. Enter password 4. Click Sign Up	Expected: Application should reject invalid email formats. Actual: User account gets created successfully with invalid email.	Medium	Missing or weak email validation logic on frontend/backend.
2	Weak Password Validation	1. Open signup page 2. Enter weak password such as 123 3. Submit form	Expected: Weak passwords should be rejected with validation message. Actual: Account gets created successfully.	Medium	Missing password strength validation rules.
3	Duplicate Email Signup Handling	1. Create account using an email 2. Try signing up again using same email	Expected: Proper duplicate email error message should appear. Actual: Error handling/message is unclear and not user friendly.	Medium	Improper backend/frontend validation and unclear error handling.

4	Article Publish/Edit/Delete Actions Without Confirmation Popup	1.Create/Edit/Delete an article 2. Perform action directly	Expected: Confirmation popup/message should appear before performing critical actions. Actual: Actions are executed immediately without confirmation.	Low	Missing confirmation modal implementation.
5	Article Publishing/Editing Allowed Without Complete Details	1. Open article editor 2. Leave some required fields empty 3. Publish or update article	Expected: Application should validate all required fields before submission. Actual: Article gets published/updated with incomplete information.	Medium	Missing required field validation.
6	Login/Logout Without Success or Confirmation Message	1. Login or logout from the application 2. Observe user feedback	Expected: User should receive confirmation or success message after authentication actions. Actual: No success or feedback message is displayed.	Low	Missing user feedback/notification handling.

Root Cause Analysis

Issue Selected: Invalid Email Validation During Signup

The application allows users to create accounts using invalid email formats such as test@abc, which indicates incomplete validation during the signup process. The frontend validation appears to only verify basic input presence rather than validating the complete email structure using standard validation techniques such

as regular expressions or dedicated validation libraries. As a result, invalid email records can be stored within the system, potentially causing authentication, communication and account management issues in later stages of the application workflow.

Additionally, weak validation negatively impacts data integrity and overall user experience. The issue may also originate from insufficient server-side validation if the backend accepts improperly formatted email addresses without verification. To resolve this issue, robust validation should be implemented on both the frontend and backend before account creation is processed. Clear and user-friendly validation messages should also be displayed to guide users in entering valid email addresses and improving the overall usability of the application.

Screenshots

Screenshot 1 – Invalid Email Validation Issue

The screenshot displays the 'Conduit' sign-up interface. At the top left is the 'Conduit' logo, and at the top right are links for 'Home', 'Sign in', and a green 'Sign up' button. The main heading is 'Sign up' with a link 'Have an account?'. Below this is a form with three input fields. The first field contains 'testing2000', the second 'testing22', and the third 'testing55'. The third field is highlighted with a red border and a red eye icon, indicating an invalid email address. A green 'Sign up' button is positioned below the third field.

Screenshot 2 – Article Publishing Without Complete Details

The screenshot shows the 'Conduit' application interface. At the top, there is a navigation bar with the 'Conduit' logo on the left and links for 'Home', 'New Article' (which is active), 'Settings', and a user profile 'dummy' on the right. The main content area contains a form for publishing an article. The form has a title input field with the text 'MERN Stack Development', a description input field with the text 'A collection of full-stack web applications developed using the MERN stack (MongoDB, Express.js, React.js and Node.js), focused on building responsive full-stack web applications using MongoDB, Express.js, React.js, and Node.js with features including authentication, REST APIs, CRUD operations.', and a tags input field with the placeholder text 'Enter tags'. A green 'Publish Article' button is located at the bottom right of the form. At the bottom of the page, there is a footer with the text 'Conduit © 2020. An interactive learning project from RealWorld OSS Project. Code licensed under MIT.'

Screenshot 3 – Article Update Without Confirmation Popup

The screenshot shows the 'Your Settings' page in the Conduit application. The page has a title 'Your Settings' at the top. Below the title, there are several input fields for user settings: 'URL of profile picture' with the value 'dummy26', 'Short bio about you' (empty), 'dummy123@gmail.com', and 'New Password' (empty). A green 'Update Settings' button is located at the bottom right of the form. At the bottom of the page, there is a link that says 'Or click here to logout'.

Conclusion

The application performs effectively across most primary user workflows; however, several validation, usability, and user feedback related issues were identified during the testing process. The identified issues primarily relate to insufficient form validation, lack of confirmation prompts for critical actions and missing user feedback mechanisms. Addressing these issues would significantly improve the overall user experience, enhance application reliability, strengthen validation handling and increase production readiness.
